THE UNIVERSITY OF CHICAGO
CLIMATE SYSTEMS ENGINEERING INITIATIVE

An Introduction to Climate Systems Engineering is a multidisciplinary exploration of emerging approaches to reduce climate change itself and mitigate some of its risks. Featuring talks by leading researchers from the University of Chicago's Climate Systems Engineering initiative (CSEI), this series will examine the science, technologies, and policy implications behind large-scale interventions such as sunlight reflection methods (SRM), open-systems carbon removal, and glacial preservation. Join us for a primer on what's possible with this emerging field and what kinds of public policy and research are needed if society chooses to pursue these tools.
