Abstract

A Master’s paper is required for the completion of a Master’s degree in Statistics. The Master’s paper is not a publication (as the name “thesis” usually implies) and does not require original mathematical or methodological research, but it does require original work. The focus of a Master’s paper is often on the application of some specific statistical methodology. A common topic is a review of the methodology completed with a thorough relevant analysis of some real data set. In general, a modified version of the paper should be publishable in a professional journal of the applied field.
