**Zoom Meeting**

## Jiexin Chen, MS candidate

In 2018, Barillas and Shanken proposed a framework of asset pricing model. And based on that, Chib, Zeng, and Zhao (2020) proposed a valid model selection method (CZZ method henceforth) designed for low-dimensional cases. Nowadays, with a growing variety of tradable factors, a natural interest in high-dimensional model selection arises. This article first extends the idea of the CZZ method to the sparse high-dimensional case. By assigning a flat prior distribution of the model space, we can use techniques like Gibbs sampling to sample from the posterior distribution of the model space. Then, the article shows using a Spike-and-Slab Lasso type of prior can greatly speed up the convergence of the sampling. Finally, the article ends with a bunch of simulation exercises that prove the validity and efficiency of our method.
